

Founder Background, Faith & Professional Statement

My name is Bryan Spruk. I am a Christian, a builder, a salesman, a systems thinker, and the founder of the Pro Prime Series AI ecosystem.

My professional background is not traditional. I did not come through a university program, venture studio, or corporate engineering track. I came through work: automotive sales, business development, welding, machining, entrepreneurship, customer service, and years of solving problems with limited resources.

My faith is part of who I am. I do not separate my belief in God from my work, my ethics, or the way I try to treat people. I believe in truth, accountability, redemption, perseverance, and building things that serve a real purpose. I do not expect every partner, investor, customer, or collaborator to share my faith, but I will not hide it to make anyone more comfortable.

That background shaped the way I build. I tend to think in systems, structures, workflows, and practical outcomes. I am not interested in technology for show. I am interested in tools that help real people preserve knowledge, operate better, protect privacy, and turn difficult work into something usable.

The projects I am building — including ORBS, GOAT, True Mark, CertSig, and related Pro Prime systems — come from that same place. They are local-first, privacy-conscious, practical systems designed to give individuals and small businesses more control over their own data, memory, work, and digital presence.

Professional Background

My working life has included more than thirty years of experience across sales, business development, technical work, entrepreneurship, and customer-facing operations.

I have worked in automotive sales and business development, including high-volume customer interaction, negotiation, follow-up systems, lead handling, sales process improvement, and dealership growth. I have held top-ranking sales positions and have built customer relationships through persistence, honesty, product knowledge, and direct communication.

I also have hands-on mechanical and technical experience. I have worked in welding, machining, fabrication, powersports, equipment repair, and business operations. I have built and operated businesses, worked with customers directly, managed difficult situations, solved practical problems, and learned how systems fail when they are not designed around real people.

That combination matters. I am not only approaching technology from a screen. I am approaching it from the real world: customers, machines, businesses, paperwork, pressure, mistakes, deadlines, and survival.

Founder Work

My current work focuses on building practical AI-assisted systems with strong emphasis on privacy, local control, auditability, memory, certification, and user ownership.

The core projects include:

- **ORBS** — a visual, local-first assistant ecosystem designed to operate across desktop, browser, website, and future product environments.
- **GOAT** — a preservation and document-processing system for turning knowledge, records, manuals, media, and personal/business material into organized, usable archives.
- **True Mark** — a certification and verification system focused on proof, ownership, and evidentiary continuity.
- **CertSig** — a certificate and tokenized-signature concept for structured proof, licensing, authorship, and preservation.
- **Pro Prime Series AI** — the larger architecture tying these systems together through local-first, privacy-conscious, deterministic design principles.

These systems are still developing, but they are not casual ideas. They represent years of thought, trial, rebuilding, and practical design work.

Background & Disclosure

There are things in my past that require directness.

I have faced legal, financial, personal, and family hardships. Some of those difficulties are part of the public record. Some were the result of my own mistakes. Some were the result of circumstances I had to survive, dispute, or rebuild from. I do not hide that my path has been difficult, and I do not present myself as someone with a perfect résumé.

I also do not see those experiences only as damage. As difficult as many of them were, they shaped the way I think, build, judge risk, read people, and solve problems. The antifragile nature of my life has forced me to become stronger under pressure, more practical under uncertainty, and more focused on what actually matters. I would not understand the systems I am building in the same way if I had lived an easier or more conventional life. I do not glorify hardship, but I do accept it as part of the path that brought me to this purpose.

What I can say clearly is this: I have worked hard to rebuild my life with honesty, sobriety, discipline, and purpose. I quit drinking years ago. I have continued working, building, learning,

and developing these systems while carrying responsibilities and obstacles that would stop many people.

I understand that partners, investors, and serious collaborators may need to ask hard questions. I respect that. I would rather answer those questions directly than pretend my background is simpler than it is.

At the same time, I ask that my work be judged by the same standard I apply to it: evidence, clarity, usefulness, integrity, and execution.

I am not presenting myself as a polished corporate founder. I am presenting myself as a real builder with real scars, real experience, faith, practical skill, and a serious commitment to creating useful systems.

I do not claim a perfect résumé. I claim accountability, persistence, sobriety, practical experience, faith, and evidence of work.

My goal is not to appear perfect.

My goal is to build something worth trusting.

My education is not built around a degree. I attended some college, but most of what I know came from work, pressure, responsibility, failure, rebuilding, technical problem solving, sales leadership, and years of learning by doing. That includes automotive management, hands-on mechanical work, entrepreneurship, and an eight-month consulting assignment in Indonesia that remains one of the strongest practical experiences of my life.

One of my strongest professional experiences was an eight-month consulting assignment in Cilegon, Indonesia, where I worked hands-on installing and retrofitting industrial machinery, including J&L turret lathes converted from pneumatic to hydraulic operation. That assignment required mechanical skill, adaptability, communication, judgment, and real-world problem solving far from familiar surroundings.

Professional Résumé Summary

Name: Bryan Spruk

Location: Joplin, Missouri / Kansas City region

Primary Fields: Automotive Sales, Business Development, AI Systems Design, Local-First Software Concepts, Knowledge Preservation, Certification Systems, Entrepreneurship

Core Strengths

- Automotive sales and customer development
- Business development and lead handling
- Customer relationship building
- Negotiation and closing
- Practical systems design
- Local-first AI product architecture
- Workflow design and process improvement
- Document preservation and certification concepts
- Mechanical, welding, machining, and fabrication background
- Entrepreneurship and small-business operations
- Problem solving under pressure
- Persistence through adversity

Professional Experience Summary

Automotive Sales & Business Development

Over thirty years of experience in automotive sales, customer development, follow-up, product presentation, negotiation, and business growth. Experienced in high-pressure sales environments, customer qualification, closing strategy, and relationship-driven selling.

Mechanical, Welding, Machining & Powersports

Hands-on experience with mechanical systems, welding, fabrication, equipment repair, powersports, scooters, and practical shop operations. This background contributes to a real-world, practical approach to systems design and product development.

Entrepreneurship & Business Building

Experience starting, operating, and rebuilding businesses under difficult conditions. Familiar with customer service, operations, sales, marketing, inventory, problem solving, and adapting under financial and logistical pressure.

AI Systems & Product Architecture

Founder and lead architect of Pro Prime Series AI concepts, including ORBS, GOAT, True Mark, CertSig, and related local-first tools. Current focus is on privacy-conscious, practical AI systems for preservation, certification, business assistance, and user-controlled digital tools.

Founder Statement

I build from experience, not theory alone. My work combines sales, mechanical understanding, business survival, personal hardship, faith, and systems thinking. I believe useful technology should help real people maintain control over their work, their records, their knowledge, and their future.

My goal is to build practical tools that are trustworthy, understandable, and valuable.
