

Professional Résumé Summary

Name: Bryan Spruk

Primary Fields: Automotive Sales & Management, Business Development, Technical Consulting, Mechanical Systems, AI Systems Design, Knowledge Preservation, Certification Systems, Entrepreneurship

Education: Some college; no degree. Primarily developed through professional experience, technical work, business ownership, self-directed study, and hands-on problem solving.

Core Strengths

- Automotive sales, management, and business development
 - Sales team leadership and dealership operations experience
 - Customer relationship building and retention
 - Negotiation, closing, follow-up, and lead handling
 - Technical consulting and field problem solving
 - Machinery retrofit and mechanical systems experience
 - Welding, machining, fabrication, and powersports background
 - Entrepreneurship and small-business operations
 - Practical systems design and workflow improvement
 - Local-first AI product architecture
 - Document preservation and certification concepts
 - Problem solving under pressure
 - Persistence through adversity
 - Faith-driven ethics, accountability, and purpose
-

Professional Experience Summary

Automotive Sales, Management & Business Development

I have more than thirty years of experience in automotive sales, customer development, dealership operations, and business growth.

My work in the auto industry has included sales, management, customer qualification, lead handling, follow-up systems, negotiation, closing strategy, inventory awareness, team coordination, and practical process improvement. I have worked in high-pressure dealership environments where results, trust, timing, communication, and persistence matter every day.

This experience taught me how to read people, manage pressure, identify buying signals, solve objections, keep customers engaged, and build relationships that last beyond a single transaction.

Technical Consulting & Indonesia Field Experience

One of my strongest professional experiences was an eight-month consulting assignment in Cilegon, Indonesia.

I traveled on a business visa as a consultant and worked hands-on installing and retrofitting industrial machinery, including J&L turret lathes converted from pneumatic to hydraulic operation. The work involved technical problem solving, mechanical adaptation, hands-on installation, field troubleshooting, communication across cultural and language barriers, and delivering results in an unfamiliar environment far from home.

That experience matters because it was not theoretical. It required practical judgment, mechanical understanding, discipline, adaptability, and the ability to solve real problems under pressure. It also helped shape the way I think about systems: how parts connect, how failure points appear, how people depend on working tools, and how practical design must survive real-world conditions.

Mechanical, Welding, Machining & Powersports

I have hands-on experience with mechanical systems, welding, machining, fabrication, powersports, scooters, equipment repair, and shop operations.

This technical background gives me a grounded view of product design. I do not look at systems only as software or abstract ideas. I think about tools, workflow, reliability, maintenance, failure points, and whether something actually works for the person using it.

Entrepreneurship & Business Building

I have started, operated, and rebuilt businesses under difficult conditions, including **Factory Direct Powersports** and the development of **factorydirectpowersports.com**.

Factory Direct Powersports included physical store operations in **Joplin, Missouri** and **Kent, Washington**, giving me direct experience with storefront setup, customer service, sales, marketing, inventory, vendor issues, repair work, logistics, and day-to-day business operations.

That experience taught me what it means to build without ideal resources. I have dealt with real customers, real overhead, real inventory, real repairs, real cash-flow pressure, and real problems that had to be solved immediately. It shaped my approach to technology: practical first, useful first, trustworthy first.

AI Systems & Product Architecture

I am the founder and lead architect of Pro Prime Series AI concepts, including ORBS, GOAT, True Mark, CertSig, and related local-first tools.

My current focus is on privacy-conscious, user-controlled systems for preservation, certification, business assistance, local AI workflows, visual assistant interfaces, and practical knowledge management.

These systems are being built from a combination of technical research, hands-on experimentation, product thinking, real business experience, and a strong belief that useful technology should serve people instead of trapping them.

Education & Learning Background

I attended some college but did not complete a degree.

Most of my education has come through work, technical responsibility, business ownership, sales management, mechanical problem solving, self-directed study, and building real systems under real pressure.

I do not present myself as a credentialed academic or traditional software engineer. I present myself as a practical builder, founder, and systems thinker who has learned through direct experience, disciplined self-education, and persistent execution.

My education is not built around a degree. I attended some college, but most of what I know came from work, pressure, responsibility, failure, rebuilding, technical problem solving, sales leadership, and years of learning by doing. That includes automotive management, hands-on mechanical work, entrepreneurship, and an eight-month consulting assignment in Indonesia that remains one of the strongest practical experiences of my life.
